Abstract AI Summary

In this paper, we develop a taxonomy of conceptual models and proxy data used for digital analysis of human emotional expression and outline how the combinations and permutations of these models and data impact their incorporation into artificial intelligence (AI) systems. We argue we should not take computer scientists at their word that the paradigms for human emotions they have developed internally and adapted from other disciplines can produce ground truth about human emotions; instead, we ask how different

Journal of the ACM

Providing coverage of the most significant work on principles of computer science, broadly construed and encompassing contributions of lasting value to computer science
