Abstract AI Summary

Recurrent neural networks are effective models to process sequences. However, they are unable to learn long-term dependencies because of their inherent sequential nature. As a solution, Vaswani et al. introduced the Transformer, a model solely based on the attention mechanism that is able to relate any two positions of the input sequence, hence modelling arbitrary long dependencies. The Transformer has improved the state-of-the-art across numerous sequence modelling tasks. However, its effectiveness comes at the expense of a

ACM/IEEE International Conference on Software Engineering is the premier forum for most recent innovations, trends, experiences, and issues in the field.

April 12 - 18, 2026
